

Cleanverse Overview

The Trusted Network for On-Chain Finance

What is Cleanverse?

Cleanverse is the trusted network for on-chain finance, enabling trusted identities and trusted digital value to interact through a common trust framework anchored by regulated financial institutions. By **interlocking Cleanverse Verified Identity (CVI) with a Cleanverse Verified Asset (CVA)**, the network ensures trust is established before digital value is issued, transferred and settled.

Cleanverse transforms open blockchain networks from ecosystems of anonymous wallets into trusted financial infrastructure for the next generation of on-chain finance.

The Cleanverse Trust Framework

The framework is built on the same institutional trust foundation of TradFi governance – known counterparties and verified source of funds.

Using technology primitives, every value transfer on the Cleanverse network delivers trust based on the interlocking of these **three assurances**:

- **Cleanverse Verified Identity (CVI)**: Every transacting wallet is bound to an individual or entity with a verified financial identity.
- **Cleanverse Verified Asset (CVA)**: Every digital asset has entered the network through an approved trust pathway, with evidenced provenance.
- **Programmed Governance**: Before value moves, eligibility is checked according to any rule(s) set by the asset issuer on the interlocking of CVI and CVA. It ensures that every transfer remains continuously traceable with auditable records in real-time.

Together, these assurances enable trusted value to move between trusted participants on a network designed for the next generation of on-chain finance.

These trust principles are operationalised through the **Cleanverse Compliance Protocol (CCP)** that defines how trusted identities and values are established, how governance policies are enforced and how trust is continuously maintained throughout the lifecycle of every transaction and digital asset.

Cleanverse Compliance Protocol

The **Cleanverse Compliance Protocol (CCP)** is the programmable trust protocol that operationalises the Cleanverse Trust Framework. It enables trust policies to be

executed consistently across participating institutions, blockchain networks and digital asset applications.

The protocol interlocks **Cleanverse Verified Identity (CVI)**, a **Cleanverse Verified Asset (CVA)** and **Programmed Governance** to ensure trust is established before value is issued, transferred or settled. It provides an infrastructure to construct policies that can govern participant eligibility, trusted counterparties, asset permissions, transfer restrictions and other operational controls for assets circulated on open blockchain.

Trust-by-Design

By interlocking **CVI** and **CVA**, every value transfer on the Cleanverse network is assured to be:

- between individuals and legal entities that own a financial or payment account issued by licensed institutions;
- using digital assets verified by the AML/compliance processes of licensed institutions;
- continuously traceable with records accessible in real-time; and
- governed by a common trust framework exercised by a network of member institutions.

Trust is therefore established **before value moves**; not after a transaction.

About Cleanverse

Cleanverse is the trusted infrastructure network for on-chain finance, designed to enable trusted value transfers between verified participants using verified digital assets. Through the Cleanverse Compliance Protocol (CCP), Cleanverse embeds trusted identity, trusted assets, and programmable governance into onchain financial transactions before value moves, supporting the development and acceleration of compliant, traceable, and interoperable blockchain-based financial services.

About Cleanverse Labs

Accelerating market-ready, compliance-native applications for verified on-chain finance.

Overview & Mission

Cleanverse Labs is the dedicated incubation hub of Cleanverse, established to transform developer-led innovation into market-ready on-chain financial applications built on Cleanverse's trusted infrastructure. Designed to carry momentum beyond hackathons like Cleanverse Build, Cleanverse Labs bridges early-stage proof-of-

concepts with institutional and commercial deployment across the decentralized finance (DeFi) ecosystem.

Cleanverse Labs aims to support development of solutions for one of the fundamental challenges in on-chain finance: embedding trust, compliance, and institutional-grade controls directly into financial software before value moves. By ensuring verified identities (participants) and verified digital assets (issued by licensed institutions) interlock natively through the **Cleanverse Compliance Protocol (CCP)**, the initiative enables compliant, traceable, and interoperable blockchain-based on-chain finance solutions.

Incubation & Builder Support

Cleanverse Labs provides selected teams with holistic operational, technical, and strategic backing to scale their applications:

- **Technical Guidance & Infrastructure:** Direct access to Cleanverse's core rules-layer architecture, chain- and wallet-agnostic verification tools, and engineering mentorship.
- **Product & Governance Advisory:** Expertise in designing applications that preserve accountability, traceability, and regulatory standards expected in regulated capital markets.
- **Ecosystem & Pilot Opportunities:** Strategic introductions to industry partners and opportunities to pilot solutions in real-world settings.

Developer Pipeline & Hackathons

Cleanverse Labs functions as the long-term execution engine for developer talent cultivated through initiatives such as the **Cleanverse Build** series.

- **June 2026 Edition:** Supported by the Monad Foundation, featuring 50+ developers across challenge tracks focusing on verified global payments and AI agent trading.
- **Upcoming Edition (August 8–9, 2026):** Focused on asset tokenization and decentralized finance applications for verified finance.
